

CRM Sales Pipeline Analysis

Business Problem

A European B2B sales organisation required a structured evaluation of its CRM data and pipeline performance across 3,000 leads registered between January and May 2024, spanning 9 countries, 14 industries, and 3 product lines.

The analysis was commissioned to assess lead conversion rates by country and industry, evaluate individual agent performance and sales cycle efficiency, determine pipeline health month-over-month, forecast weighted income from the active pipeline, and identify the primary characteristics of won versus lost opportunities.

Analytical Framework

The CRM export was normalised into a star schema within Power BI: one fact table (FACT_CRM, 3,000 rows) and six dimension tables covering Agents, Countries, Industries, Organisation Size, Products, and a custom Calendar spanning January 2024 to December 2025.

34 DAX measures were developed across four analytical themes: Pipeline Health, Agent Performance, Revenue Intelligence, and Win/Loss Diagnostics. Three calculated columns quantify sales cycle duration, planned cycle duration, and close date forecast variance per lead.

Headline Results

Total Leads	Customers	Total Deal Value	Win Rate
3,000	171	\$8M	57.6%
<i>Jan - May 2024</i>	<i>5.7% conversion rate</i>	<i>Weighted forecast \$4M</i>	<i>Lost rate 42.4%</i>

Key Results

Pipeline Health

The funnel reveals a critical bottleneck between Opportunity (867 leads) and Customer (171), with only 19.7% converting. A further 177 churn post-conversion, nearly matching new customer additions. Monthly lead volume is stable (538 to 647), with March as the peak month.

Agent Performance

Sarah Davis leads with a 72.7% Win Rate. Laura Thompson manages the most leads (749) at 6.4% conversion. David Wilson is the clearest underperformer at 33.3% Win Rate and 3.4% conversion with a comparable workload to Sarah. This is a skills gap, not a volume problem.

Revenue Intelligence

Enterprise organisations have a median deal value of \$13K versus \$1K for Micro, a 13x difference. Yet Enterprise and Large represent only 4.4% of the portfolio. Custom solution has the highest per-deal value (\$1,664) but the fewest leads (558), representing the highest-growth opportunity.

Win/Loss Diagnostics

Lost deals average \$3K versus won deals at \$2K, indicating the team disproportionately loses higher-value contracts. All 5 months show negative Close Date Variance, meaning deals close earlier than forecast, suggesting expected dates are systematically too conservative.

CRM Sales Pipeline Analysis

Recommendations and Business Impact

The following recommendations are drawn directly from CRM Sales Pipeline Analysis data. Each is paired with the specific business impact it addresses, quantified where the data supports it.

#	Recommendation	Business Impact
1	Address the Opportunity-to-Customer bottleneck. Investigate what separates the 83 Won deals from the 784 that did not convert.	✓ Only 19.7% of Opportunity leads convert, representing the single largest pipeline leak. ✓ Doubling conversion to 40% would add ~174 customers without generating a single new lead.
2	Coach David Wilson urgently using Sarah Davis as a benchmark. Both carry similar lead volumes but produce dramatically different results.	✓ David: 33.3% Win Rate, 3.4% conversion. Sarah: 72.7% Win Rate, 6.0% conversion on a comparable lead volume. ✓ Matching Sarah's win rate would add an estimated 26 additional won deals per cycle.
3	Develop a targeted strategy for closing high-value deals where the team currently underperforms.	✓ Lost deals average \$3K versus won deals at \$2K. Larger contracts are disproportionately lost. ✓ Improving close rates on high-value deals grows Total Won Value without requiring more leads.
4	Grow the Custom solution pipeline with targeted prospecting and marketing investment.	✓ Custom solution has the highest median deal value (\$1,664) but fewest leads (558, 18.6% of portfolio). ✓ A 20% increase in Custom solution leads adds ~112 high-value opportunities to the pipeline.
5	Prioritise Enterprise and Large organisation leads. Small increases in this segment have outsized revenue impact.	✓ Enterprise median deal value is \$13K; Large is \$12K, versus \$1K for Micro and Small. ✓ Enterprise + Large are only 4.4% of the portfolio. Ten more Enterprise leads adds ~\$130K in pipeline value.
6	Review and recalibrate expected close date forecasting methodology across the sales team.	✓ All 5 months show negative Close Date Variance, with deals consistently closing earlier than forecast. ✓ Accurate forecasting improves pipeline planning, resource allocation, and executive reporting.
